outline

▶ context & result

- ▶ computing with matrices over \mathbb{K} and $\mathbb{K}[x]$
- ▶ reductions to matrix multiplication
- ▶ framework for complexity bounds

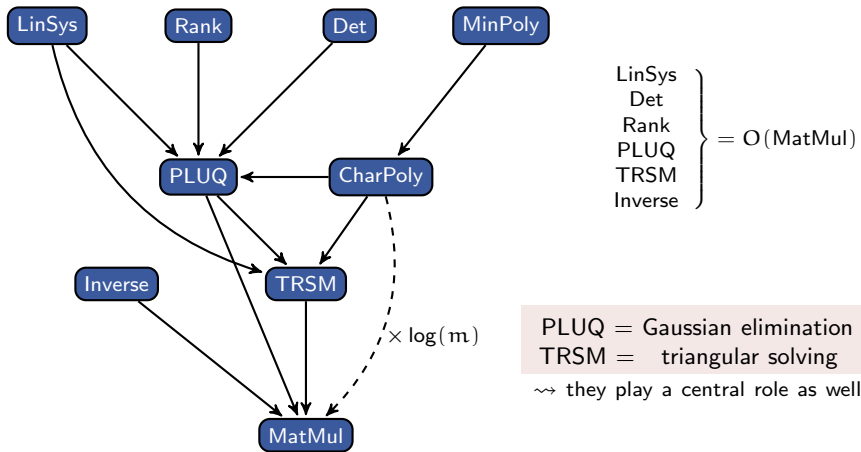

▶ previous work

▶ overview of the approach

▶ obstacles & spin-offs

matrices: main computational problems

reductions of most problems to matrix multiplication

matrices: multiplication

$$\mathbf{M} = \begin{bmatrix} 28 & 68 & 75 & 70 \\ 38 & 25 & 75 & 55 \\ 24 & 1 & 56 & 28 \end{bmatrix} \in \mathbb{K}^{3 \times 4} \longrightarrow 3 \times 4 \text{ matrix over } \mathbb{K} \text{ (here } \mathbb{F}_{97}\text{)}$$

fundamental operations on $m \times m$ matrices:

- ▶ **addition** is “quadratic”: $O(m^2)$ operations in \mathbb{K}
- ▶ naive **multiplication** is cubic: $O(m^3)$

[Strassen'69]

subcubic matrix multiplication

matrices: multiplication

$$\mathbf{M} = \begin{bmatrix} 28 & 68 & 75 & 70 \\ 38 & 25 & 75 & 55 \\ 24 & 1 & 56 & 28 \end{bmatrix} \in \mathbb{K}^{3 \times 4} \longrightarrow 3 \times 4 \text{ matrix over } \mathbb{K} \text{ (here } \mathbb{F}_{97}\text{)}$$

fundamental operations on $m \times m$ matrices:

- ▶ **addition** is “quadratic”: $O(m^2)$ operations in \mathbb{K}
- ▶ naive **multiplication** is cubic: $O(m^3)$

[Strassen'69]

subcubic matrix multiplication

- ▶ complexity **exponent** $\omega \approx 2.81$ — i.e. $O(m^\omega)$ complexity
- ▶ **used in practice** for $m \geq$ a few 100s
in NTL, FLINT, fflas-ffpack...

- ▶ best-known exponent $\omega \approx 2.373$
[Le Gall'14] [Alman-Williams'20]
- ▶ “galactic” algorithms: strongly impractical as such

measuring efficiency: algebraic complexity

efficient algorithms for polynomials, matrices, ...
with coefficients in some base field \mathbb{K}

- ▶ low complexity bound
- ▶ low execution time

low memory usage, power consumption, ...

prime field $\mathbb{F}_p = \mathbb{Z}/p\mathbb{Z}$
field extension $\mathbb{F}_p[x]/\langle f(x) \rangle$
rational numbers \mathbb{Q}

measuring efficiency: algebraic complexity

efficient algorithms for polynomials, matrices, ...
with coefficients in some base field \mathbb{K}

- ▶ low complexity bound
- ▶ low execution time

low memory usage, power consumption, ...

prime field $\mathbb{F}_p = \mathbb{Z}/p\mathbb{Z}$
field extension $\mathbb{F}_p[x]/\langle f(x) \rangle$
rational numbers \mathbb{Q}

algebraic complexity bounds

\rightsquigarrow count number of operations in \mathbb{K}

- 👍 standard complexity model for algebraic computations
- 👍 good predictor of practical performance for finite fields \mathbb{K}
- 👎 ignores coefficient growth, e.g. over $\mathbb{K} = \mathbb{Q}$

characteristic polynomial of a matrix

given $\mathbf{M} \in \mathbb{K}^{m \times m}$, compute $\det(x\mathbf{I}_m - \mathbf{M}) \in \mathbb{K}[x]$

characteristic polynomial of a matrix

given $\mathbf{M} \in \mathbb{K}^{m \times m}$, compute $\det(x\mathbf{I}_m - \mathbf{M}) \in \mathbb{K}[x]$

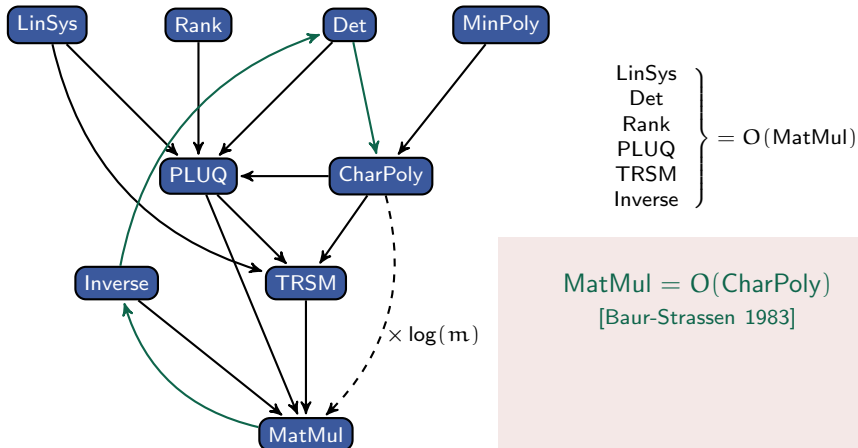

\mathbb{K} -linear algebra: **reductions** of most problems to **matrix multiplication**

characteristic polynomial of a matrix

given $\mathbf{M} \in \mathbb{K}^{m \times m}$, compute $\det(x\mathbf{I}_m - \mathbf{M}) \in \mathbb{K}[x]$

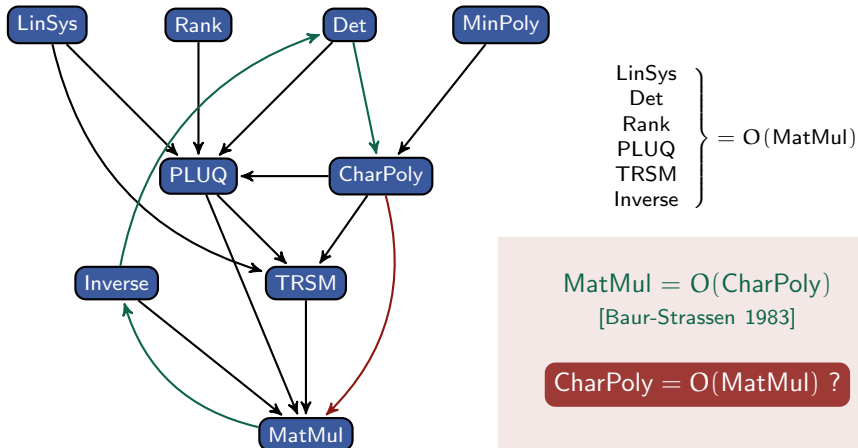

\mathbb{K} -linear algebra: reductions of most problems to matrix multiplication

characteristic polynomial of a matrix

given $\mathbf{M} \in \mathbb{K}^{m \times m}$, compute $\det(x\mathbf{I}_m - \mathbf{M}) \in \mathbb{K}[x]$

\mathbb{K} -linear algebra: reductions of most problems to matrix multiplication

[Vincent Neiger & Clément Pernet, 2021]
deterministic algorithm with complexity $O(m^\omega)$

- ▶ polynomial matrices
- ▶ partial triangularization

- ▶ exploiting degree knowledge

characteristic polynomial in the time of matrix multiplication

[Vincent Neiger & Clément Pernet, 2021]
deterministic algorithm with complexity $O(m^\omega)$

- ▶ polynomial matrices
- ▶ partial triangularization
- ▶ ternary divide and conquer
- ▶ exploiting degree knowledge

characteristic polynomial in the time of matrix multiplication

summary of previous results

- ▶ deterministic, general: $O(m^\omega \log(m))$ [Keller-Gehrig 1985]
- ▶ deterministic, **generic input**: $O(m^\omega)$ [Giorgi-Jeannerod-Villard 2003]
- ▶ **randomized**, general: $O(m^\omega)$ [Pernet-Storjohann 2007]

[Vincent Neiger & Clément Pernet, 2021]
deterministic algorithm with complexity $O(m^\omega)$

- ▶ polynomial matrices
- ▶ partial triangularization
- ▶ ternary divide and conquer
- ▶ exploiting degree knowledge

characteristic polynomial in the time of matrix multiplication

framework for complexity — clarification is needed!

For any MatMul exponent ω feasible (as of today),
there is a MatMul algorithm in $O(m^{\omega-\varepsilon})$ for some $\varepsilon > 0$
 \Rightarrow the CharPoly algorithm of [Keller-Gehrig'85] is

- ▶ deterministic
- ▶ in $O(m^{\omega-\varepsilon} \log(m)) \subset O(m^\omega)$

not entirely satisfactory...

[Vincent Neiger & Clément Pernet, 2021]
deterministic algorithm with complexity $O(m^\omega)$

- ▶ polynomial matrices
- ▶ partial triangularization
- ▶ ternary divide and conquer
- ▶ exploiting degree knowledge

characteristic polynomial in the time of matrix multiplication

framework for complexity — classical requirements

matrix multiplication in $\mathbb{K}^{m \times m}$

- ▶ choose a MatMul algorithm in $O(m^\omega)$
 - ▶ use [this one](#) for all MatMul instances
- our requirement: $2 < \omega \leq 3$

we gladly accept $\omega = 2.1$, please provide the algorithm

requirement: matrices in $\mathbb{K}[x]_{\leq d}^{m \times m}$
multiplied in $O(m^\omega M(d))$

polynomial multiplication in $\mathbb{K}[x]$

- ▶ choose a PolMul algorithm in $O(M(d))$
- ▶ use [this one](#) for all PolMul instances

our requirement: $M(d)$ is **superlinear** and **submultiplicative** and **reasonably good**

$$2M(d) \leq M(2d)$$

$$M(d_1 d_2) \leq M(d_1)M(d_2)$$

$$M(d) \in O(d^{\omega-1-\varepsilon}) \text{ for some } \varepsilon > 0$$

polynomial matrices

$$\mathbf{A} = \begin{bmatrix} 3x + 4 & x^3 + 4x + 1 & 4x^2 + 3 \\ 5 & 5x^2 + 3x + 1 & 5x + 3 \\ 3x^3 + x^2 + 5x + 3 & 6x + 5 & 2x + 1 \end{bmatrix} \in \mathbb{K}[x]^{3 \times 3}$$

3×3 matrix of degree 3
with entries in $\mathbb{K}[x] = \mathbb{F}_7[x]$

operations on $\mathbb{K}[x]_{<d}^{m \times m}$

- ▶ combination of matrix and polynomial computations
- ▶ addition in $O(m^2 d)$, naive multiplication in $O(m^3 d^2)$

[Cantor-Kaltofen'91]

multiplication in $O(m^\omega d \log(d) + m^2 d \log(d) \log \log(d))$

$\in O(m^\omega M(d)) \subset \tilde{O}(m^\omega d)$

polynomial matrices

$$\mathbf{A} = \begin{bmatrix} 3x + 4 & x^3 + 4x + 1 & 4x^2 + 3 \\ 5 & 5x^2 + 3x + 1 & 5x + 3 \\ 3x^3 + x^2 + 5x + 3 & 6x + 5 & 2x + 1 \end{bmatrix} \in \mathbb{K}[x]^{3 \times 3}$$

3×3 matrix of degree 3
with entries in $\mathbb{K}[x] = \mathbb{F}_7[x]$

operations on $\mathbb{K}[x]_{<d}^{m \times m}$

- ▶ combination of matrix and polynomial computations
- ▶ **addition** in $O(m^2 d)$, naive **multiplication** in $O(m^3 d^2)$

[Cantor-Kaltofen'91]

multiplication in $O(m^\omega d \log(d) + m^2 d \log(d) \log \log(d))$

$\in O(m^\omega M(d)) \subset \tilde{O}(m^\omega d)$

charpoly: matrix $x\mathbf{I}_m - \mathbf{M}$ is $m \times m$ of degree 1

→ during algorithm: **smaller** size, **larger** degree

- ▶ some problems&techniques **shared** with matrices over \mathbb{K}
- ▶ some problems&techniques **specific** to entries in $\mathbb{K}[x]$

polynomial matrices: main computational problems

reductions of most problems to polynomial matrix multiplication

matrix $m \times m$ of degree d $\rightarrow O^{\sim}(m^{\omega} d)$
of "average" degree $\frac{D}{m}$ $\rightarrow O^{\sim}(m^{\omega} \frac{D}{m})$

classical matrix operations

- ▶ multiplication
- ▶ inversion $O^{\sim}(m^3 d)$
- ▶ kernel, system solving
- ▶ rank, determinant

univariate relations

- ▶ Hermite-Padé approximation
- ▶ vector rational interpolation
- ▶ syzygies, modular equations

transformation to normal forms

- ▶ triangularization: Hermite form
- ▶ row reduction: Popov form
- ▶ diagonalization: Smith form

overview of the approach

obstacles & spin-offs

charpoly via \mathbb{K} -linear algebra

charpoly via \mathbb{K} -linear algebra

traces of powers

$O(m^4)$ or $O(m^{\omega+1})$

- ▶ [LeVerrier 1840] [Faddeev'49, Souriau'48, ...]
- ▶ used by [Csanky'75] to prove $\text{CharPoly} \in \mathcal{NC}^2$

charpoly via \mathbb{K} -linear algebra

traces of powers

$O(m^4)$ or $O(m^{\omega+1})$

- ▶ [LeVerrier 1840] [Faddeev'49, Souriau'48, ...]
- ▶ used by [Csanky'75] to prove CharPoly $\in \mathcal{NC}^2$

determinant expansion

$O(m^4)$

- ▶ [Samuelson'42, Berkowitz'84]
- ▶ suited to division free algorithms
[Abdlejaoued-Malaschonok'01, Kaltofen-Villard'05]

charpoly via \mathbb{K} -linear algebra

traces of powers

$O(m^4)$ or $O(m^{\omega+1})$

- ▶ [LeVerrier 1840] [Faddeev'49, Souriau'48, ...]
- ▶ used by [Csanky'75] to prove CharPoly $\in \mathcal{NC}^2$

determinant expansion

$O(m^4)$

- ▶ [Samuelson'42, Berkowitz'84]
- ▶ suited to division free algorithms
[Abdlejaoued-Malaschonok'01, Kaltofen-Villard'05]

Krylov methods [Danilevskij'37, Keller-Gehrig'85, P.-Storjohann'07]

- ▶ deterministic $O(m^3)$ or $O(m^\omega \log(m))$
- ▶ **generic** $O(m^\omega)$
- ▶ Las Vegas **randomized**, requires **large field** $O(m^\omega)$

i.e. $\text{card}(\mathbb{K}) \geq 2m^2$

charpoly via polynomial matrices

determinant of matrix $\mathbf{A} \in \mathbb{K}[x]^{m \times m}$

charpoly via polynomial matrices

determinant of matrix $\mathbf{A} \in \mathbb{K}[x]^{m \times m}$

evaluation-interpolation [folklore]

$O(m^{\omega+1})$

at $\sim m \cdot d$ points, requires large field

costs: for \mathbf{A} of degree $d = 1$

charpoly via polynomial matrices

determinant of matrix $\mathbf{A} \in \mathbb{K}[x]^{m \times m}$

evaluation-interpolation [folklore] $O(m^{\omega+1})$

at $\sim m \cdot d$ points, requires large field

costs: for \mathbf{A} of degree $d = 1$

diagonalization [Storjohann 2003] $O(m^{\omega} \log(m)^2)$

Smith form: Las Vegas randomized, requires large field

charpoly via polynomial matrices

determinant of matrix $\mathbf{A} \in \mathbb{K}[x]^{m \times m}$

evaluation-interpolation [folklore] $O(m^{\omega+1})$

at $\sim m \cdot d$ points, requires large field

costs: for \mathbf{A} of degree $d = 1$

diagonalization [Storjohann 2003] $O(m^{\omega} \log(m)^2)$

Smith form: Las Vegas randomized, requires large field

partial triangularization

- ▶ iterative [Mulders-Storjohann 2003] $O(m^3)$
via weak Popov form computations
- ▶ divide and conquer, **generic** [Giorgi-Jeannerod-Villard 2003] $O(m^{\omega})$
diagonal of Hermite form must be $1, \dots, 1, \det(\mathbf{A})$
- ▶ divide and conquer [N.-Labahn-Zhou 2017] $\tilde{O}(m^{\omega})$
logarithmic factors **in** m and d

- ▶ divide and conquer with half-dimension blocks \rightarrow no $\log(m)$
- ▶ iterative approaches in m steps \rightarrow sometimes no $\log(m)$ [Pernet-Storjohann'07]
- ▶ explicit Krylov iteration: compute $(v \quad Mv \quad \dots \quad M^m v) \rightarrow \log(m)$

in \mathbb{K} -linear algebra

sources of log factors

for polynomial matrices

- ▶ divide and conquer with half-dimension blocks \rightarrow no $\log(m)$
- ▶ iterative approaches in m steps \rightarrow sometimes no $\log(m)$ [Pernet-Storjohann'07]
- ▶ explicit Krylov iteration: compute $(v \quad Mv \quad \dots \quad M^m v) \rightarrow \log(m)$

in \mathbb{K} -linear algebra

sources of log factors

for polynomial matrices

- ▶ divide and conquer with half-dimension blocks \rightarrow no $\log(m)$
provided degrees are controlled, e.g. kernel basis [Zhou-Labahn-Storjohann'12]
- ▶ divide and conquer on degree $\rightarrow \log(d)$ but no $\log(m)$
e.g. $\mathbb{K}[x]$ -MatMul and approximant basis [Giorgi-Jeannerod-Villard'03]
- ▶ explicit Krylov iterations on constant matrices e.g. [Jeannerod-N.-Schost-Villard'17]
since base cases of recursions on degree = matrices over \mathbb{K}
typically adds $O(m^\omega d \log(m))$ to the cost, non-negligible when $d = O(1)$
- ▶ looking for a matrix with unpredictable, unbalanced degrees
 $\log(m)$ steps in dimension $m \times m$, to uncover the degree profile [Zhou-Labahn'13]
reminiscent of obstacles in the derandomization of [Pernet-Storjohann'07]

obstacles & spin-offs

partial block triangularization

[Mulders-Storjohann 2003, Giorgi-Jeanerod-Villard 2003, Zhou 2012, N.-Labahn-Zhou 2017]

triangularization of $m \times m$ matrix \mathbf{A} using $\frac{m}{2} \times \frac{m}{2}$ blocks

not computed

$$\begin{bmatrix} * & * \\ \mathbf{K}_1 & \mathbf{K}_2 \end{bmatrix} \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{bmatrix} = \begin{bmatrix} \mathbf{R} & * \\ \mathbf{0} & \mathbf{B} \end{bmatrix}$$

kernel basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$

$$\mathbf{K}_1 \mathbf{A}_2 + \mathbf{K}_2 \mathbf{A}_4$$

row basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$

property: $\det(\mathbf{A}) = \det(\mathbf{R}) \det(\mathbf{B})$

partial block triangularization

[Mulders-Storjohann 2003, Giorgi-Jeannerod-Villard 2003, Zhou 2012, N.-Labahn-Zhou 2017]

triangularization of $m \times m$ matrix \mathbf{A} using $\frac{m}{2} \times \frac{m}{2}$ blocks

$$\begin{array}{c} \text{not computed} \rightarrow \\ \left[\begin{array}{cc} * & * \\ \mathbf{K}_1 & \mathbf{K}_2 \end{array} \right] \left[\begin{array}{cc} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{array} \right] = \left[\begin{array}{cc} \mathbf{R} & * \\ \mathbf{0} & \mathbf{B} \end{array} \right] \end{array}$$

kernel basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$ $\mathbf{K}_1 \mathbf{A}_2 + \mathbf{K}_2 \mathbf{A}_4$ row basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$

property: $\det(\mathbf{A}) = \det(\mathbf{R}) \det(\mathbf{B})$

generic input $\Rightarrow \det(\mathbf{A})$ without $\log(m)$

[Giorgi-Jeannerod-Villard'03]

\mathbf{A}_1 and \mathbf{A}_3 are coprime $\Rightarrow \mathbf{R} = \mathbf{I}_{m/2} \Rightarrow \det(\mathbf{A}) = \det(\mathbf{B})$

- ▶ compute kernel $[\mathbf{K}_1 \ \mathbf{K}_2]$; deduce \mathbf{B} by MatMul $O(m^\omega M(d) \log(d))$
- ▶ recursively, compute $\det(\mathbf{B})$, return it

\mathbf{A} and $[\mathbf{K}_1 \ \mathbf{K}_2]$ have degree $d \Rightarrow \mathbf{B}$ has degree $2d$: controlled total degree

complexity $\mathcal{C}(m, d) = \mathcal{C}(\frac{m}{2}, 2d) + O(m^\omega M(d) \log(d))$

partial block triangularization

[Mulders-Storjohann 2003, Giorgi-Jeanerod-Villard 2003, Zhou 2012, N.-Labahn-Zhou 2017]

triangularization of $m \times m$ matrix \mathbf{A} using $\frac{m}{2} \times \frac{m}{2}$ blocks

$$\begin{matrix} \text{not computed} & \begin{matrix} \left[\begin{array}{cc} * & * \\ \mathbf{K}_1 & \mathbf{K}_2 \end{array} \right] \end{matrix} & \begin{matrix} \downarrow \\ \left[\begin{array}{cc} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{array} \right] \end{matrix} & = & \begin{matrix} \left[\begin{array}{cc} \mathbf{R} & * \\ \mathbf{0} & \mathbf{B} \end{array} \right] \end{matrix} \end{matrix}$$

kernel basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$

$$\mathbf{K}_1 \mathbf{A}_2 + \mathbf{K}_2 \mathbf{A}_4$$

row basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$

property: $\det(\mathbf{A}) = \det(\mathbf{R}) \det(\mathbf{B})$

general input $\Rightarrow \det(\mathbf{A})$ with $\log(m)$

[Labahn-N.-Zhou'17]

matrix degree not controlled: degree of \mathbf{B} up to $D = \sum \text{rdeg}(\mathbf{A}) \leq md$
but controlled average row degree: at most $\frac{D}{m}$

- ▶ compute kernel $[\mathbf{K}_1 \ \mathbf{K}_2]$; deduce \mathbf{B} by MatMul $O^{\sim}(m^{\omega} \frac{D}{m})$
- ▶ compute row basis \mathbf{R} $O^{\sim}(m^{\omega} \frac{D}{m})$ with $\log(m)$
- ▶ recursively, compute $\det(\mathbf{R})$ and $\det(\mathbf{B})$, return $\det(\mathbf{R}) \det(\mathbf{B})$

partial block triangularization

[Mulders-Storjohann 2003, Giorgi-Jeanerod-Villard 2003, Zhou 2012, N.-Labahn-Zhou 2017]

triangularization of $m \times m$ matrix \mathbf{A} using $\frac{m}{2} \times \frac{m}{2}$ blocks

$$\begin{array}{c} \text{not computed} \end{array} \begin{bmatrix} * & * \\ \mathbf{K}_1 & \mathbf{K}_2 \end{bmatrix} \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{bmatrix} = \begin{bmatrix} \mathbf{R} & * \\ \mathbf{0} & \mathbf{B} \end{bmatrix}$$

kernel basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$

$$\mathbf{K}_1 \mathbf{A}_2 + \mathbf{K}_2 \mathbf{A}_4$$

row basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$

$$\text{property: } \det(\mathbf{A}) = \det(\mathbf{R}) \det(\mathbf{B})$$

be lazy: if hard to compute, don't compute

[N.-Pernet'21]

obstacle = removing log factors in row basis computation

\Rightarrow solution: remove row basis computation

$$\begin{bmatrix} \mathbf{I}_{m/2} & \mathbf{0} \\ \mathbf{K}_1 & \mathbf{K}_2 \end{bmatrix} \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{bmatrix} = \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{0} & \mathbf{B} \end{bmatrix}$$

$$\text{property: } \det(\mathbf{A}) = \det(\mathbf{A}_1) \det(\mathbf{B}) / \det(\mathbf{K}_2)$$

further obstacles (consequences of laziness)

$$\begin{bmatrix} \mathbf{I}_{m/2} & \mathbf{0} \\ \mathbf{K}_1 & \mathbf{K}_2 \end{bmatrix} \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{bmatrix} = \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{0} & \mathbf{B} \end{bmatrix}$$

property: $\det(\mathbf{A}) = \det(\mathbf{A}_1) \det(\mathbf{B}) / \det(\mathbf{K}_2)$

further obstacles (consequences of laziness)

$$\begin{bmatrix} \mathbf{I}_{m/2} & \mathbf{0} \\ \mathbf{K}_1 & \mathbf{K}_2 \end{bmatrix} \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{bmatrix} = \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{0} & \mathbf{B} \end{bmatrix}$$

property: $\det(\mathbf{A}) = \det(\mathbf{A}_1) \det(\mathbf{B}) / \det(\mathbf{K}_2)$

👍 no $\log(m)$ in the computation of \mathbf{A}_1 , \mathbf{B} , \mathbf{K}_2

👎 requires nonsingular \mathbf{A}_1 , otherwise $\det(\mathbf{K}_2) = 0$

👎 3 recursive calls in matrix size $m/2$ is 👍, but requires $\sum \text{rdeg}(\mathbf{A}_1) \leq D/2$
otherwise degree control is too weak. (this implies $\sum \text{rdeg}(\mathbf{K}_2) \leq D/2$)

further obstacles (consequences of laziness)

$$\begin{bmatrix} \mathbf{I}_{m/2} & \mathbf{0} \\ \mathbf{K}_1 & \mathbf{K}_2 \end{bmatrix} \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{bmatrix} = \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{0} & \mathbf{B} \end{bmatrix}$$

property: $\det(\mathbf{A}) = \det(\mathbf{A}_1) \det(\mathbf{B}) / \det(\mathbf{K}_2)$

👍 no $\log(m)$ in the computation of \mathbf{A}_1 , \mathbf{B} , \mathbf{K}_2

👎 requires nonsingular \mathbf{A}_1 , otherwise $\det(\mathbf{K}_2) = 0$

👎 3 recursive calls in matrix size $m/2$ is 👍, but requires $\sum \text{rdeg}(\mathbf{A}_1) \leq D/2$
otherwise degree control is too weak. (this implies $\sum \text{rdeg}(\mathbf{K}_2) \leq D/2$)

solution: require \mathbf{A} in weak Popov form

(the characteristic matrix $\mathbf{A} = x\mathbf{I}_m - \mathbf{M}$ is in Popov form)

👍 implies \mathbf{A}_1 nonsingular and $\sum \text{rdeg}(\mathbf{A}_1) \leq D/2$ up to easy transformations

👍 both \mathbf{A}_1 and \mathbf{B} are also in weak Popov form \Rightarrow suitable for recursive calls

👎 \mathbf{K}_2 is in “shifted reduced” form... find weak Popov \mathbf{P} with same determinant

further obstacles (consequences of laziness)

$$\begin{bmatrix} \mathbf{I}_{m/2} & \mathbf{0} \\ \mathbf{K}_1 & \mathbf{K}_2 \end{bmatrix} \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{bmatrix} = \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{0} & \mathbf{B} \end{bmatrix}$$

property: $\det(\mathbf{A}) = \det(\mathbf{A}_1) \det(\mathbf{B}) / \det(\mathbf{K}_2)$

👍 no $\log(m)$ in the computation of \mathbf{A}_1 , \mathbf{B} , \mathbf{K}_2

👎 requires nonsingular \mathbf{A}_1 , otherwise $\det(\mathbf{K}_2) = 0$

👎 3 recursive calls in matrix size $m/2$ is 👍, but requires $\sum \text{rdeg}(\mathbf{A}_1) \leq D/2$
otherwise degree control is too weak. (this implies $\sum \text{rdeg}(\mathbf{K}_2) \leq D/2$)

solution: require \mathbf{A} in weak Popov form

(the characteristic matrix $\mathbf{A} = x\mathbf{I}_m - \mathbf{M}$ is in Popov form)

👍 implies \mathbf{A}_1 nonsingular and $\sum \text{rdeg}(\mathbf{A}_1) \leq D/2$ up to easy transformations

👍 both \mathbf{A}_1 and \mathbf{B} are also in weak Popov form \Rightarrow suitable for recursive calls

👎 \mathbf{K}_2 is in “shifted reduced” form... find weak Popov \mathbf{P} with same determinant

solution: exploit degree knowledge to accelerate transformations

s -reduced \Rightarrow s -weak Popov \Rightarrow s -Popov

ternary recursion & complexity analysis

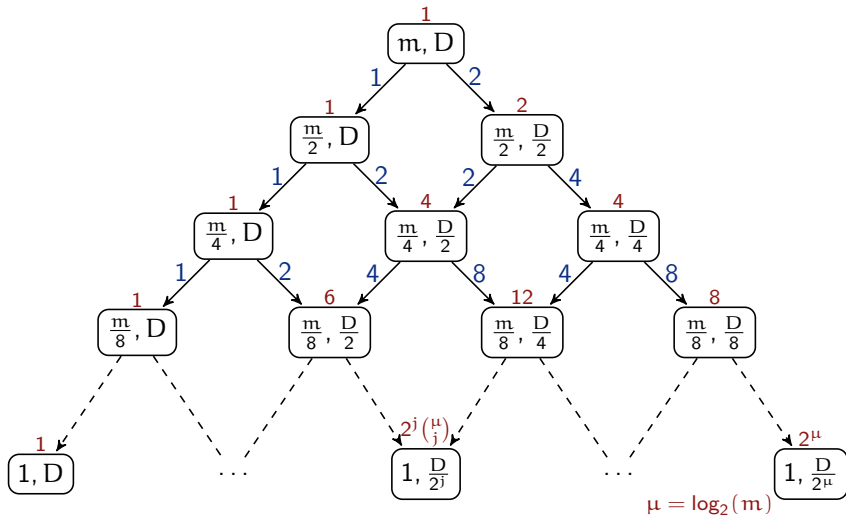

determinant of $\mathbf{A} \in \mathbb{K}[x]^{m \times m}$ of average row degree $\frac{D}{m} = \frac{\text{degdet}}{m}$

$$\mathcal{C}(m, D) \leq 2\mathcal{C}\left(\frac{m}{2}, \frac{D}{2}\right) + \mathcal{C}\left(\frac{m}{2}, D\right) + O(m^\omega M\left(\frac{D}{m}\right) \log\left(\frac{D}{m}\right))$$

ternary recursion & complexity analysis

determinant of $\mathbf{A} \in \mathbb{K}[x]^{m \times m}$ of average row degree $\frac{D}{m} = \frac{\text{degdet}}{m}$

Hermite and Popov forms

working over $\mathbb{K} = \mathbb{Z}/7\mathbb{Z}$

$$\mathbf{A} = \begin{bmatrix} 3x + 4 & x^3 + 4x + 1 & 4x^2 + 3 \\ 5 & 5x^2 + 3x + 1 & 5x + 3 \\ 3x^3 + x^2 + 5x + 3 & 6x + 5 & 2x + 1 \end{bmatrix}$$

using elementary row operations, transform \mathbf{A} into...

$$\text{Hermite form } \mathbf{H} = \begin{bmatrix} x^6 + 6x^4 + x^3 + x + 4 & 0 & 0 \\ 5x^5 + 5x^4 + 6x^3 + 2x^2 + 6x + 3 & x & 0 \\ 3x^4 + 5x^3 + 4x^2 + 6x + 1 & 5 & 1 \end{bmatrix}$$

$$\text{Popov form } \mathbf{P} = \begin{bmatrix} x^3 + 5x^2 + 4x + 1 & 2x + 4 & 3x + 5 \\ 1 & x^2 + 2x + 3 & x + 2 \\ 3x + 2 & 4x & x^2 \end{bmatrix}$$

Hermite and Popov forms

nonsingular $\mathbf{A} \in \mathbb{K}[x]^{m \times m}$

elementary row transformations

Hermite form [Hermite, 1851]

- ▶ triangular
- ▶ column normalized

$$\begin{bmatrix} 16 & & & \\ 15 & 0 & & \\ 15 & & 0 & \\ 15 & & & 0 \end{bmatrix} \quad \begin{bmatrix} 4 & & & \\ 3 & 7 & & \\ 1 & 5 & 3 & \\ 3 & 6 & 1 & 2 \end{bmatrix}$$

Hermite and Popov forms

nonsingular $\mathbf{A} \in \mathbb{K}[x]^{m \times m}$

elementary row transformations

Hermite form [Hermite, 1851]

- ▶ triangular
- ▶ column normalized

$$\begin{bmatrix} 16 & & & \\ 15 & 0 & & \\ 15 & & 0 & \\ 15 & & & 0 \end{bmatrix} \quad \begin{bmatrix} 4 & & & \\ 3 & 7 & & \\ 1 & 5 & 3 & \\ 3 & 6 & 1 & 2 \end{bmatrix}$$

Popov form [Popov, 1972]

- ▶ row reduced/distinct pivots
- ▶ column normalized

$$\begin{bmatrix} 4 & 3 & 3 & 3 \\ 3 & 4 & 3 & 3 \\ 3 & 3 & 4 & 3 \\ 3 & 3 & 3 & 4 \end{bmatrix} \quad \begin{bmatrix} 7 & 0 & 1 & 5 \\ 0 & 1 & & 0 \\ & & 2 & \\ 6 & 0 & 1 & 6 \end{bmatrix}$$

Hermite and Popov forms

nonsingular $\mathbf{A} \in \mathbb{K}[x]^{m \times m}$

elementary row transformations

Hermite form [Hermite, 1851]

- ▶ triangular
- ▶ column normalized

Popov form [Popov, 1972]

- ▶ row reduced/distinct pivots
- ▶ column normalized

$$\begin{bmatrix} 16 & & & \\ 15 & 0 & & \\ 15 & & 0 & \\ 15 & & & 0 \end{bmatrix} \quad \begin{bmatrix} 4 & & & \\ 3 & 7 & & \\ 1 & 5 & 3 & \\ 3 & 6 & 1 & 2 \end{bmatrix} \quad \begin{bmatrix} 4 & 3 & 3 & 3 \\ 3 & 4 & 3 & 3 \\ 3 & 3 & 4 & 3 \\ 3 & 3 & 3 & 4 \end{bmatrix} \quad \begin{bmatrix} 7 & 0 & 1 & 5 \\ 0 & 1 & & 0 \\ & & 2 & \\ 6 & 0 & 1 & 6 \end{bmatrix}$$

⋈_{pot}

reduced Gröbner basis

⋈_{top}

$\mathbb{K}[x]$ -module $\mathcal{M} \subset \mathbb{K}[x]^{1 \times m}$ of rank m

Hermite and Popov forms

nonsingular $\mathbf{A} \in \mathbb{K}[x]^{m \times m}$

elementary row transformations

Hermite form [Hermite, 1851]

- ▶ triangular
- ▶ column normalized

Popov form [Popov, 1972]

- ▶ row reduced/distinct pivots
- ▶ column normalized

$$\begin{bmatrix} 16 & & & \\ 15 & 0 & & \\ 15 & & 0 & \\ 15 & & & 0 \end{bmatrix}$$

$$\begin{bmatrix} 4 & & & \\ 3 & 7 & & \\ 1 & 5 & 3 & \\ 3 & 6 & 1 & 2 \end{bmatrix}$$

$$\begin{bmatrix} 4 & 3 & 3 & 3 \\ 3 & 4 & 3 & 3 \\ 3 & 3 & 4 & 3 \\ 3 & 3 & 3 & 4 \end{bmatrix}$$

$$\begin{bmatrix} 7 & 0 & 1 & 5 \\ 0 & 1 & & 0 \\ & & 2 & \\ 6 & 0 & 1 & 6 \end{bmatrix}$$

invariant: $D = \deg(\det(\mathbf{A})) = 4 + 7 + 3 + 2 = 7 + 1 + 2 + 6$

- ▶ average column degree is $\frac{D}{m}$
- ▶ size of object is $mD + m^2 = m^2(\frac{D}{m} + 1)$

Hermite and Popov forms

nonsingular $\mathbf{A} \in \mathbb{K}[x]^{m \times m}$

elementary row transformations

Hermite form [Hermite, 1851]

- ▶ triangular
- ▶ column normalized

Popov form [Popov, 1972]

[Beckermann-Labahn-Villard, 1999; Mulders-Storjohann, 2003]

weak Popov form = not column normalized

= minimal, non-reduced, t.o.p. Gröbner basis

shifted forms

shift: integer tuple $\mathbf{s} = (s_1, \dots, s_m)$ acting as **column weights**
→ connects Popov and Hermite forms

$$\begin{array}{l} \mathbf{s} = (0, 0, 0, 0) \\ \text{Popov} \end{array} \quad \begin{bmatrix} 4 & 3 & 3 & 3 \\ 3 & 4 & 3 & 3 \\ 3 & 3 & 4 & 3 \\ 3 & 3 & 3 & 4 \end{bmatrix} \quad \begin{bmatrix} 7 & 0 & 1 & 5 \\ 0 & 1 & & 0 \\ & & 2 & \\ 6 & 0 & 1 & 6 \end{bmatrix}$$

$$\begin{array}{l} \mathbf{s} = (0, 2, 4, 6) \\ \text{s-Popov} \end{array} \quad \begin{bmatrix} 7 & 4 & 2 & 0 \\ 6 & 5 & 2 & 0 \\ 6 & 4 & 3 & 0 \\ 6 & 4 & 2 & 1 \end{bmatrix} \quad \begin{bmatrix} 8 & 5 & 1 & \\ 7 & 6 & 1 & \\ & & 2 & \\ 0 & 1 & & 0 \end{bmatrix}$$

$$\begin{array}{l} \mathbf{s} = (0, D, 2D, 3D) \\ \text{Hermite} \end{array} \quad \begin{bmatrix} 16 & & & \\ 15 & 0 & & \\ 15 & & 0 & \\ 15 & & & 0 \end{bmatrix} \quad \begin{bmatrix} 4 & & & \\ 3 & 7 & & \\ 1 & 5 & 3 & \\ 3 & 6 & 1 & 2 \end{bmatrix}$$

- ▶ **normal** form, **average** column degree D/m
- ▶ shifts arise naturally in algorithms (approximants, kernel, ...)
- ▶ they allow one to specify non-uniform degree constraints

back to obstacles: easy ones

recall: $\mathbf{A} = \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{bmatrix}$ in weak Popov form, we want:

▶ \mathbf{A}_1 nonsingular: ok by definition

(principal submatrices of \mathbf{A} are weak Popov \Rightarrow are nonsingular)

▶ $\sum \text{rdeg}(\mathbf{A}_1) \leq D/2$: either ok for \mathbf{A} , or ok for $\begin{bmatrix} \mathbf{A}_4 & \mathbf{A}_3 \\ \mathbf{A}_2 & \mathbf{A}_1 \end{bmatrix}$

(almost weak Popov... easily transformed into it, with same determinant)

back to obstacles: easy ones

recall: $\mathbf{A} = \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{bmatrix}$ in weak Popov form, we want:

- ▶ \mathbf{A}_1 nonsingular: ok by definition
(principal submatrices of \mathbf{A} are weak Popov \Rightarrow are nonsingular)
- ▶ $\sum \text{rdeg}(\mathbf{A}_1) \leq D/2$: either ok for \mathbf{A} , or ok for $\begin{bmatrix} \mathbf{A}_4 & \mathbf{A}_3 \\ \mathbf{A}_2 & \mathbf{A}_1 \end{bmatrix}$
(almost weak Popov... easily transformed into it, with same determinant)

shifts in kernel basis computation [Zhou-Labahn-Storjohann'12]

$[\mathbf{K}_1 \ \mathbf{K}_2]$ kernel basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$ computed in $\text{rdeg}(\mathbf{A})$ -weak Popov form:
cost $O(m^\omega M'(\frac{D}{m}))$, $\sum \text{rdeg}(\mathbf{K}_2) \leq D/2$, \mathbf{K}_2 in \mathbf{s} -weak Popov form

$D = \sum \text{rdeg}(\mathbf{A}) = \deg \det(\mathbf{A})$ $\mathbf{s} = \text{rdeg}(\mathbf{A}_4) = \text{last } m/2 \text{ entries of } \text{rdeg}(\mathbf{A})$

using the shift $\text{rdeg}(\mathbf{A})$ (and \mathbf{s}) has **crucial advantages**:

- ▶ *towards correctness*: $\mathbf{B} = [\mathbf{K}_1 \ \mathbf{K}_2] \begin{bmatrix} \mathbf{A}_2 \\ \mathbf{A}_4 \end{bmatrix}$ is in $\mathbf{0}$ -weak Popov form
- ▶ *towards efficiency*: implies **small degrees in \mathbf{K}_2**
and **best speed** both for kernel and product \mathbf{B}

back to obstacles: easy ones

recall: $\mathbf{A} = \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{bmatrix}$ in weak Popov form, we want:

- ▶ \mathbf{A}_1 nonsingular: ok by definition
(principal submatrices of \mathbf{A} are weak Popov \Rightarrow are nonsingular)
- ▶ $\sum \text{rdeg}(\mathbf{A}_1) \leq D/2$: either ok for \mathbf{A} , or ok for $\begin{bmatrix} \mathbf{A}_4 & \mathbf{A}_3 \\ \mathbf{A}_2 & \mathbf{A}_1 \end{bmatrix}$
(almost weak Popov... easily transformed into it, with same determinant)

shifts in kernel basis computation [Zhou-Labahn-Storjohann'12]

$[\mathbf{K}_1 \ \mathbf{K}_2]$ kernel basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$ computed in $\text{rdeg}(\mathbf{A})$ -weak Popov form:
cost $O(m^\omega M'(\frac{D}{m}))$, $\sum \text{rdeg}(\mathbf{K}_2) \leq D/2$, \mathbf{K}_2 in \mathbf{s} -weak Popov form

$D = \sum \text{rdeg}(\mathbf{A}) = \deg \det(\mathbf{A})$ $\mathbf{s} = \text{rdeg}(\mathbf{A}_4) = \text{last } m/2 \text{ entries of } \text{rdeg}(\mathbf{A})$

using the shift $\text{rdeg}(\mathbf{A})$ (and \mathbf{s}) has **crucial advantages**:

- ▶ *towards correctness*: $\mathbf{B} = [\mathbf{K}_1 \ \mathbf{K}_2] \begin{bmatrix} \mathbf{A}_2 \\ \mathbf{A}_4 \end{bmatrix}$ is in $\mathbf{0}$ -weak Popov form
- ▶ *towards efficiency*: implies **small degrees in \mathbf{K}_2**
and **best speed** both for kernel and product \mathbf{B}

... but we cannot call the algorithm recursively on \mathbf{K}_2

approaching the main obstacle

input: \mathbf{K}_2 in \mathbf{s} -weak Popov form, with $\mathbf{s} \geq 0$

output: \mathbf{P} in $\mathbf{0}$ -weak Popov form, with $\det(\mathbf{P}) = \det(\mathbf{K}_2)$

approaching the main obstacle

input: \mathbf{K}_2 in \mathbf{s} -weak Popov form, with $\mathbf{s} \geq 0$

output: \mathbf{P} in $\mathbf{0}$ -weak Popov form, with $\det(\mathbf{P}) = \det(\mathbf{K}_2)$

Idea 1.a: change of shift from \mathbf{s} to $\mathbf{0}$, i.e. $\mathbf{P} = \text{WeakPopov}(\mathbf{K}_2)$

👉 known methods are only efficient for increasing \mathbf{s} to a larger shift

[Jeannerod-N.-Schost-Villard'17]

Idea 1.b: normalization of \mathbf{K}_2 into its \mathbf{s} -Popov form \mathbf{P}

$\rightsquigarrow \mathbf{P}^\top$ is $\mathbf{0}$ -weak Popov by construction, and $\det(\mathbf{P}^\top) = \det(\mathbf{P})$

👉 amounts to a change of shift from \mathbf{s} to $-\delta \leq 0$ [N.'16] \Rightarrow same issue

approaching the main obstacle

input: \mathbf{K}_2 in \mathbf{s} -weak Popov form, with $\mathbf{s} \geq 0$

output: \mathbf{P} in $\mathbf{0}$ -weak Popov form, with $\det(\mathbf{P}) = \det(\mathbf{K}_2)$

Idea 1.a: change of shift from \mathbf{s} to $\mathbf{0}$, i.e. $\mathbf{P} = \text{WeakPopov}(\mathbf{K}_2)$

🔴 known methods are only efficient for increasing \mathbf{s} to a larger shift

[Jeannerod-N.-Schost-Villard'17]

Idea 1.b: normalization of \mathbf{K}_2 into its \mathbf{s} -Popov form \mathbf{P}

$\rightsquigarrow \mathbf{P}^T$ is $\mathbf{0}$ -weak Popov by construction, and $\det(\mathbf{P}^T) = \det(\mathbf{P})$

🔴 amounts to a change of shift from \mathbf{s} to $-\delta \leq 0$ [N.'16] \Rightarrow same issue

Fact: \mathbf{K}_2^T is $-\mathbf{t}$ -weak Popov, for some $-\mathbf{t} \leq 0$

▶ $\mathbf{t} = \text{rdeg}_s(\mathbf{K}_2) = \mathbf{s} + \delta \geq 0$

▶ ignoring some row/column permutations for simplicity

approaching the main obstacle

input: \mathbf{K}_2 in \mathbf{s} -weak Popov form, with $\mathbf{s} \geq 0$

output: \mathbf{P} in $\mathbf{0}$ -weak Popov form, with $\det(\mathbf{P}) = \det(\mathbf{K}_2)$

Idea 1.a: change of shift from \mathbf{s} to $\mathbf{0}$, i.e. $\mathbf{P} = \text{WeakPopov}(\mathbf{K}_2)$

🔴 known methods are only efficient for increasing \mathbf{s} to a larger shift

[Jeannerod-N.-Schost-Villard'17]

Idea 1.b: normalization of \mathbf{K}_2 into its \mathbf{s} -Popov form \mathbf{P}

$\rightsquigarrow \mathbf{P}^T$ is $\mathbf{0}$ -weak Popov by construction, and $\det(\mathbf{P}^T) = \det(\mathbf{P})$

🔴 amounts to a change of shift from \mathbf{s} to $-\delta \leq 0$ [N.'16] \Rightarrow same issue

Fact: \mathbf{K}_2^T is $-\mathbf{t}$ -weak Popov, for some $-\mathbf{t} \leq 0$

▶ $\mathbf{t} = \text{rdeg}_s(\mathbf{K}_2) = \mathbf{s} + \delta \geq 0$

▶ ignoring some row/column permutations for simplicity

Idea 2.a: change of shift from $-\mathbf{t}$ to $\mathbf{0}$, i.e. $\mathbf{P} = \text{WeakPopov}(\mathbf{K}_2^T)$

🔴 increasing shift, but \mathbf{K}_2^T has large average rdeg (we control $\text{cdeg}(\mathbf{K}_2^T) = \text{rdeg}(\mathbf{K}_2)$)

approaching the main obstacle

input: \mathbf{K}_2 in \mathbf{s} -weak Popov form, with $\mathbf{s} \geq 0$

output: \mathbf{P} in $\mathbf{0}$ -weak Popov form, with $\det(\mathbf{P}) = \det(\mathbf{K}_2)$

Idea 1.a: change of shift from \mathbf{s} to $\mathbf{0}$, i.e. $\mathbf{P} = \text{WeakPopov}(\mathbf{K}_2)$

🚫 known methods are only efficient for increasing \mathbf{s} to a larger shift

[Jeannerod-N.-Schost-Villard'17]

Idea 1.b: normalization of \mathbf{K}_2 into its \mathbf{s} -Popov form \mathbf{P}

$\rightsquigarrow \mathbf{P}^T$ is $\mathbf{0}$ -weak Popov by construction, and $\det(\mathbf{P}^T) = \det(\mathbf{P})$

🚫 amounts to a change of shift from \mathbf{s} to $-\delta \leq 0$ [N.'16] \Rightarrow same issue

🚫 increasing shift, but \mathbf{K}_2^T has large average rdeg (we control $\text{cdeg}(\mathbf{K}_2^T) = \text{rdeg}(\mathbf{K}_2)$)

Idea 2.b: 🍀🍀🍀 normalization of \mathbf{K}_2^T into its $-\mathbf{t}$ -Popov form \mathbf{P}

spin-offs: faster transformations of shifted forms

weak Popov \rightarrow Popov

Input:	$\mathbf{s} \in \mathbb{Z}^m$, a shift, $\mathbf{A} \in \mathbb{K}[x]^{m \times m}$, a matrix in \mathbf{s} -weak Popov form
Output:	the \mathbf{s} -Popov form of \mathbf{A}
Requirement:	$-\mathbf{s} \geq \text{DiagonalDegrees}(\mathbf{A})$
Complexity:	$O(m^\omega M(\frac{D}{m}) \log(\frac{D}{m}))$, where $D = \sum \mathbf{s}$

improvement and generalization of [Sarkar-Storjohann 2011, Section 4]

\rightsquigarrow support **nonzero shifts** and involve **average degree** $\frac{D}{m}$

- ▶ problem viewed as a change of shift with known output degrees
- ▶ introduction of partial linearization techniques for kernel bases

spin-offs: faster transformations of shifted forms

weak Popov \rightarrow Popov

Input: $\mathbf{s} \in \mathbb{Z}^m$, a shift,
 $\mathbf{A} \in \mathbb{K}[x]^{m \times m}$, a matrix in \mathbf{s} -weak Popov form

Output: the \mathbf{s} -Popov form of \mathbf{A}

Requirement: $-\mathbf{s} \geq \text{DiagonalDegrees}(\mathbf{A})$

Complexity: $O(m^\omega M(\frac{D}{m}) \log(\frac{D}{m}))$, where $D = \sum \mathbf{s}$

improvement and generalization of [Sarkar-Storjohann 2011, Section 4]

\rightsquigarrow support **nonzero shifts** and involve **average degree** $\frac{D}{m}$

- ▶ problem viewed as a change of shift with known output degrees
- ▶ introduction of partial linearization techniques for kernel bases

reduced \rightarrow weak Popov

Input: $\mathbf{s} \in \mathbb{Z}^n$, a shift
 $\mathbf{A} \in \mathbb{K}[x]^{m \times n}$, a matrix in \mathbf{s} -reduced form

Output: an \mathbf{s} -weak Popov form of \mathbf{A}

Complexity: $O(m^{\omega-1} n (\frac{D}{m} + 1))$, where $D = \sum \text{rdeg}_s(\mathbf{A}) - m \min(\mathbf{s})$

easy extension of [Sarkar-Storjohann 2011, Section 3] to shifted forms

open questions: Frobenius and Smith forms

deterministic, log-free Frobenius form

$$\left[\begin{array}{c} \mathbf{M} \end{array} \right] \longrightarrow \left[\begin{array}{c} \mathbf{C}_{s_1} \\ \mathbf{C}_{s_2} \\ \vdots \\ \mathbf{C}_{s_m} \end{array} \right]$$

s_{i+1} divides s_i

- ▶ complexity $O(m^\omega)$ [Pernet-Storjohann'07]
- ▶ Las Vegas, requires large field
- ▶ exploit the new CharPoly techniques?

deterministic algo in $O(m^\omega)$?

open questions: Frobenius and Smith forms

deterministic, log-free Frobenius form

$$\left[\begin{array}{c} \mathbf{M} \end{array} \right] \longrightarrow \left[\begin{array}{cccc} C_{s_1} & & & \\ & C_{s_2} & & \\ & & \ddots & \\ & & & C_{s_m} \end{array} \right]$$
